

Traceability made simple

Dunstable Meats needed to provide lot traceability of the meat and poultry cuts it supplies to a key client to provide evidence of due diligence and secure its business against strong competition.

The company chose the M725 DP Data Management System to replace its manual method of recording and reporting.

Carcasses are weighed on receipt from the slaughterhouse on a wall-mounted scale and the lot number entered onto the system. Finished boxes of products are then weighed on a floor scale prior to despatch and compared against the lot number of the carcasses used. This provides full lot traceability and analysis of yield, to ensure maximum productivity.

Previously, operators entered information from the butchers' tickets into a spreadsheet and then compiled a report on the type and amount of each product issued to the customer during the month. The new system calculates this information automatically and saves the company at least a day each month.

Reports can be generated simply with the minimum of operator input and the layout tailored to suit the end customer, increasing the company's profile and customer confidence.

- Eliminates manual record keeping for greater efficiency.
- Provides evidence of due diligence to satisfy traceability legislation.
- Fulfils the key client's requirements for full lot traceability and a monthly record of invoices – with minimum effort.
- Provides accurate, reliable data – helping to control product wastage and manage yield efficiencies

TECHNICAL

M725 DP Data Management System

The M725 integrates with a variety of different scale types for easier materials handling.

- Includes a 'Wizard' function to enable the system to be tailored to the client's requirements.
- Report generator module, for presentation of information in a preferred format and style.
- Configurable indicator soft keys provide operator prompting to assist with data entry.
- Indicator available in IP65 stainless steel housing for hygienic environments.
